Bridging the Gap Between Data and Evidence

The use of a cellular phone generates a trail of electronic evidence. Who was called? What time did the call start and end? Which cell towers were used to process the call and where are those towers located? Details of each call a cell phone makes are retained by the cellular carrier. These records are known as Call Detail Records, or CDR's, and they contain a wealth of information if you know how to read and interpret them.

**Our one day seminar provides investigators with a general overview of Cell Phone Call Detail Records and Cell Tower Records, providing insight into the potential evidence they contain.**

In our one day course, we will discuss the basics of how a cell phone works, what call detail records look like and how to determine the tower location from a set of CDR's. We will also review real-world scenarios so that you and your investigators can begin to see how this type of evidence can be applied to cases that you are presently investigating.

Through a practical exercise, you will learn the basic concepts behind what it takes to plot cell tower information onto a map in order to make it presentation ready.

**If Your Suspect's Cell Phone Ends Up In The Property Locker Instead Of The Evidence Locker, You May Be Overlooking Valuable Evidence.**
